POWER MODE SELECTOR SWITCH, ITEM 364	364FN001 9V778596-4 (1)	2/IR		364FN001: DCN/Fan Power switch falls in SCU position when toggle placed in battery position.	END ITEM: Switch remains in SCU position when toggle placed in battery position.	A. Design - Each of the three switches is sealed in a dry nitrogen filled hermetically sealed case. The switches are per MIL-S-8805/4G with the 10 amp contacts are silver plated. Switch contacts rated for 10 amperes. Actual current flow is 3.0 amperes. The switch is designed to withstand a toggle force of 25 lbs. without degradation in subsequent performance. The ball socket of the toggle pivot is greased (Braycote 601) prior to assembly. BFE INTERFACE: Loss of battery power to DC/DC converter and Fan when in battery mode and SCU is disconnected. This failure would not be detected until SCU is disconnected. MISSION: Terminate EVA. Loss of use of EMU. CREW/VEHICLE: None.

2/1R 364FM006:

FAILURE EFFECT RATIONALE FOR ACCEPTANCE

To preclude failure due to internal contamination, the switches are assembled by the vendor in an environmentally controlled room. Assembly and processing is per MIL-S-883C/46. The switches receive in-process cycling and leak checks. The entire Item 364 is x-ray inspected for acceptability of brazing.

D. Failure History -

J-EMU-300-006 (10-18-03)

The EITE light failed to turn on upon power switchover during PTT tests. The outage was found to be caused by a mechanical failure of the Power Mode Switch (364) which prevented proper power switchover. EC 62806-366 added a pull test to the 364 vendor tests to insure the switch toggle arm would not come loose during normal use. This EC created the -2 switch configuration. Certified 1/84 per SEMU-S40.

E. Ground Turnaround -

Switches are tested during FEMU-R-001, EMU Vacuum Chamber Run, EMU Checkout in Orbiter, Orbiter Power Interface, and SEMU Down & Bloom Check.

F. Operational Use -

Crew Response - PreEVA: Troubleshoot problem, if no success, consider third EMU if available. Otherwise, EMU go for EVA standby.

EVA: Terminate EVA.

Training - Standard training covers this failure mode.
Operational Considerations - EVA checklist procedures verify hardware integrity and systems operational status prior to EVA. Flight rules define go/no go criteria related to EMU battery power. Fuel Time Gate System allows ground monitoring of EMU systems.
